The M280 Trinocular Microscope is a robust and versatile instrument designed for a wide range of applications, particularly those requiring photomicrography. Its key feature is the trinocular viewing head, which allows for both comfortable visual observation through the eyepieces and seamless integration with a microscope camera. This setup enables users to capture high-quality images and videos of their specimens, essential for documentation, analysis, and collaboration. The M280 is equipped with four Plan achromatic objectives (4X, 10X, 40X, and 100X). These Plan objectives are designed to provide exceptional image flatness across the entire field of view, resulting in sharper, more consistent images, especially important for photomicrography. The range of magnifications offered by these objectives allows for versatile use, from low-power scanning to high-magnification detail observation.
